

## ABSTRACT

This invention provide a synthetic resin film for color copying or printing, the front surface of which is coated with anti-static agents so that the value of 5 insulation electrical resistance of the front surface may be in the range of  $9.99 \times 10^7$  ohms to  $1.00 \times 10^6$  ohms, when measured in copying or printing circumference having the temperature of 20 °C and the humidity of 65 %, and which can copy or print distinct color images without shading of images and disorder of the images on the front surface.
